ABSTRACT

PROBLEM TO BE SOLVED: To judge quality of a die **model** formed on the basis of CAD data.

SOLUTION: **Product** shape data formed by assuming **product** shape after working is input (S1), working dimension data when working is added to the **product** shape data (S2), and a **work** shape **model** is formed on the basis of the **product** shape data (S3). The **product** shape data is input in a separate place (S4), and working pass data containing a tool track when working products is added to the **product** shape data (S5), and a working pass shape **model** is formed on the basis of the **product** shape data (S6). The **work** shape **model** and the working pass shape **model** are overlapped with each other to device whether dimension of a working part of the **work** shape **model** exists within a regulation range or not (S7 and S8), and whether dynamic balance of the formed parts shape **model** exists with the regulation range or not is decided (S9 and S10). When both the dimension of the working part and the dynamic balance exist within the regulation range, a die **model** for forming **product** shape before working is formed on the basis of the **work** shape **model** (S11).
